Sequence 244546, Application US/10027632

Publication No. US20020198371A1

GENERAL INFORMATION:

APPLICANT: Wang, David G.

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

TITLE OF INVENTION: Identification and Mapping of Single Nucleotide

FILE REFERENCE: 108827.129

CURRENT APPLICATION NUMBER: US/10/227, 632

CURRENT FILING DATE: 2000-07-12

PRIOR PILING DATE: 2000-07-12

Publication No. US20030165831A1

GENERAL INFORMATION:

APPLICANT: Lee, John
APPLICANT: Lillie, James
TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS, KITS, AND METHODS FOR TITLE OF INVENTION: IDENTIFICATION, ASSESSMENT, PREVENTION, AND TITLE OF INVENTION: THERAPY OF OVARIAN CANCER

TITLE OF INVENTION: THERAPY OF OVARIAN CANCER
FILE REFERENCE: MRI-006B

CURRENT APPLICATION NUMBER: US 60/191,031

Not I; Site 2: Sal I; The library was prepared by Catherine S. Lee and has not been published. The pancreas was obtained from Gerard Gradwoll (PNAS 97 P1607-1611, 2000). The cDNA's were prepared with an oligo containing a NotI site, and Sall linkers were added to the ends. The inserts were cut with NotI before being cloned into the NotI-Sall sites in the vectors. This is one of two libraries, ngn3 wt and ngn3 -/-. The wt library is in pSPORTI, T7 promoter is 5'."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is parvovirus non-structure protein 1 (NS1) variant (T463A). The invention relates to the variants of the parvovirus nonstructure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)

(T394A). The invention relates to the variants of the parvovirus non-
structure protein (NSI) having a shifted equilibrium between the DNA
replication and transcription activities, and the cytotoxicity activity.
These variants are useful as toxins for treating tumoural diseases. The
variant DNAS are useful as vectors for gene therapy. (Updated on 06-AUG-

The present sequence is a parvovirus wild-type non-structure protein 1 (NS1). The present invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytocoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and
                                                                                                                                                                                                                                                                             Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NSI; non-structure protein 1; cytostatic; gene therapy; toxin; therapy; tumoural disease; gene therapy; mutant; mutein; variant.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present sequence is parvovirus non-structure protein 1 (NSI) variant (T363A). The invention relates to the variants of the parvovirus nonstructure protein (NSI) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotxcicty activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel parvovirus non-structure protein variant, useful for treating tumoral diseases, has a shifted equilibrium between DNA replication and transcription activities, and cytotoxic activity.

                                                                                             The present sequence is parvovirus non-structure protein 1 (NS1) variant (S281A). The invention relates to the variants of the parvovirus non-structure protein (NS1) having a shifted equilibrium between the DNA replication and transcription activities, and the cytotoxicity activity. These variants are useful as toxins for treating tumoural diseases. The variant DNAs are useful as vectors for gene therapy. (Updated on 06-AUG-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence encoded by the double-stranded replicative form DNA of porcine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Polypeptide obtd. by recombinant DNA methods - for vaccination against parvovirus infections in man and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The inventors claim an immunologically active polypeptide for the development of vaccinal immunity against parvovirus infection. Also claimed are DNA sequences wholly or partly duplicative of defined sequences. The polypeptides are used in vaccines for conferring protection against parvovirus infections in man and animals. The present invention relates to method for producing peptides, polypeptides, or proteins having a predetermined property. The method compisions of a producing a population of sets of polymucleotide sequences that encode modified forms of a target protein, (b) introducing each set of polymucleotide sequences into host cells and expressing the encoded protein, where the host cells are present in an addressable array, and contein, where the host cells are present in an addressable array, and protein, where the host cells are present in an addressable array, and contein, where the host cells are present in an addressable array, and proteins, particularly those that act in complex biological settings, by rational miteagenesis. The method is also used for generating protein variants and for titering viruses. ABU97391-ABU97952 represent Adeno associated virus (AAV) mutant rep proteins used as an exemplification of the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at the vipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing proteins with a predetermined property comprises introducing nucleic acids encoding a modified target protein into host cells and expressing and screening for proteins with different activity than the target protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polypeptide production; protein production; target protein;

```
The present invention relates to method for producing peptides, polypeptides, or proteins having a predetermined property. The method compariess (a) producing a population of sets of polymuclectide sequences that encode modified forms of a target protein, (b) introducing each set of polymuclectide sequences into host cells and expressing the encoded protein, where the host cells are present in an addressable array, and protein, where the host cells are present in an addressable array, and protein, where the host cells are present in an addressable array, and protein, performing high throughput directed evolution of peptides and proteins, particularly those that act in complex biological settings, by raziants and for titering viruses. ABU97391-ABU97952 represent Adeno associated virus (AAV) mutant rep proteins used as an exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in clearny twips. The muthod is clectronic format directly from WIPO at the vibo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                        Producing proteins with a predetermined property comprises introducing nucleic acids encoding a modified target protein into host cells and expressing and screening for proteins with different activity than the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     mutant; mutein; adeno-associated virus; AAV; anti-HIV; gene therapy; Rep 78; human papilloma virus; HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              69.9%; Score 72; DB 6; Length 397; 65.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel adeno-associated virus (AAV), comprising an uncleic acid encoding the sequence comprising 19-621 amino acids, given in the specification. A virus of the invention has anti-HIV activity, and may have a use in gene therapy. The protein used in the invention is Rep Ps protein. The AAV is useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

a nucleic acid encoding the sequence comprising 19-621 amino acids, given in the specification. A virus of the invention has anti-HIV activity, and may have a use in gene therapy. The protein used in the invention is Rep 78 protein. The Apvisi useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New library of fusion nucleic acids each encoding a Rep protein recognized by a nucleic acid modification enzyme and a candidate protein, useful for detecting protein-protein interactions, protein drug discovery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Fusion nucleic acid library; Rep protein; tumour cell; apoptosis; nucleic acid modification enzyme; cell death; decreased cell growth; protein-protein interaction detection; cell division; cancer therapy;
                                                                                                                New adeno-associated virus, useful for preparing a composition for treating or inhibiting human papilloma virus or HIV infection.
                                                                                                                                                                                    The invention relates to a novel adeno-associated virus (AAV),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  protein drug discovery; pharmacogenetics; NS1 protein

to a library of fusion nucleic acids, each encoding a Rep protein, a candidate protein, a presentation structure, a targeting sequence or a clabel. The Rep protein is a nucleic acid modification enzyme. The random or directed libraries (including the CDNA libraries) can be introduced into any tumour cell, and peptides identified which by themselves induce apoptosis, cell death, loss of cell division or decreased cell growth. The methods and compositions may also be used to detect protein protein interactions, protein drug discovery, particularly for protein drugs that interact with targets on cell surfaces, to discover DNA or nucleic acid binding proteins, using nucleic acids as targets, to screen for nucleic acid modification enzymes with decreased toxicity for the host cells, to identify or generate Rep proteins with decreased toxicity, improved caryme attachment sequences for use in expression vectors and in commandation calls. The method is useful in cancer therapy and in the commandation of the companied with other cancer therapeutics (drugs or radiation) to sensitize cells and thus induce therapeutics (drugs or radiation) to sensitize cells and thus induce care conference co
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid/protein conjugate; NAP; nucleic acid modification; NAM; EAS; enzyme attachment sequence; cancer therapy; protein-protein interaction; drug discovery; NS1 protein; gene therapy; cytostatic.

WPI; 2002-691653/74. N-PSDB; AAD46143 Generating a library of fusion nucleic acids for treating cancer or infection, or detecting protein-protein interaction, comprises providing computationally-derived library of candidate protein sequences and expression vectors.

Disclosure, Page 199-201; 246pp; English.

The present invention relates to a novel method of generating a library of fusion nucleic acids. The method involves providing a computationally-derived library of candidate protein sequences and creating a library of expression vectors containing a fusion nucleic acid having a sequence 

a candidate protein sequence from the library and an enzyme attachment sequence (EAS) that is recognised by the NAM enzyme. The invention also relates to the use of a variety of computation methods including protein design automation (PDA). The method is useful in generating and screening fusion nucleic acids that may be used in treating cancer or infections, in detecting protein interactions, discovery of DNA or nucleic acids in protein interactions, screening for nucleic with decreased toxicity to the host cells and NAM enzyme/EAS pairs with increased affinity or in pharmacogenetic studies. The invention is also used in gene therapy. The present sequence is goose parvovirus NS1 protein. This sequence is used to illustrate the method of the invention encoding a nucleic acid modification (NAM) enzyme and a sequence encoding

Liu Y; Li M, WPI; 2002-667068/71. N-PSDB; AAD44605 New library of prokaryotic pET-24a expression vectors, host cells or nucleic acid/protein conjugates, useful for screening candidate proteins and their nucleic acids or modification enzymes for pharmacogenetic analysis

Disclosure, Fig 31; 127pp; English.

The invention relates to methods and compositions for the construction of prokaryotic libraries expressing candidate proteins and the use of these libraries to identify candidate proteins and the nucleic acids encoding them. The invention provides a library of prokaryotic pET-24a vectors comprising a fusion nucleic acid consisting of a nucleic acid encoding a nucleic acid modification (NAM) enzyme or a candidate protein, or a nucleic acid acid arming a Ty promoter operably linked to the NAM enzyme or the candidate protein, and an enzyme attachment sequence (EAS) recognised by the NAM enzyme. The library is used for identifying candidate proteins and nucleic acids encoding these proteins, in screening for NAM enzymes

with decreased toxicity for the host cells, or in identifying novel or improved EASs, which may be used for understanding cellular processes or any subsequent thrarapeutic or toxic activities. The nucleic acid/protein (NAP) conjugates are useful in diagnostic assays and in research including clinical pharmacology, functional genomics, pharmacogenomics, agricultural chemicals, environmental safety assessment, chemical sensor, nutrient biology, cosmetic research or enzymology. These may also be used in in vitro screening techniques and in assays with target molecules. The present sequence is Goose parvovirus NSI protein used in the invention 88888888888

--- FUNCTION: Seems necessary for viral DNA replication.
--- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                        Bergeron J., Hebert B., Tijssen P.; "Genome organization of the Kresse strain of porcine parvovirus: identification of the allotropic determinant and comparison with those of NADL-2 and field isolates.";

-!- FUNCTION: Seems necessary for viral DNA replication.
-!- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.

J. Gen. Virol. 72:867-875(1991).
-:- FUNCTION: Seems necessary for viral DNA replication.
-:- SIMILARITY: Belongs to the parvoviruses noncapsid protein family.
                                                                                                                                                                                                                                                                                                                        Gaps

--- PATHWAY: Histidine biosynthesis; fourth step.
--- SUBCELIULAR LOCATION: Cytoplasmic (By similarity).
--- SIMILARITY: Belongs to the hish / hisF family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6A35CF9153C32B1E CRC64;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
